Smart City Bike Sharing: One-Page Report

Source: Power BI dashboard (25 cities, 2,850 stations, 57,156 stands). Utilization = bikes available / total stands.

Objective

Assess the health of bike-sharing stations across cities, find where the network is underperforming, and recommend actions to improve availability and usage.

Stations	Bikes available	Utilization	Empty stations	Closed stations
2,850	**19,635**	**34.4%**	**24.6% (702)**	**7.2% (204)**

Insights

1. **Closures drive the worst performance.** Vilnius (0%), Rouen (0.2%), Cergy-Pontoise (1.5%), Mulhouse (2.1%), Santander (2.1%) and Marseille (2.5%) have 40-97% of stations closed. Closed stations sit at 2% utilization versus 36.5% for open ones.
2. **Strong performers are mid-sized cities.** Lund (54%), Ljubljana (49%), Namur (47%) and Seville (43%) lead. Jcdecauxbike tops the list at 66%, but it has only 12 stations, so treat it with caution.
3. **Big cities are average.** Lyon (37%), Toulouse (35%) and Dublin (34%) sit near the overall mean. Toulouse, Lyon and Valence still see about 18-23% of stations empty.
4. **Station size matters.** Large stations reach 41% utilization, medium 32% and small 29%.
5. **Performance mix:** 42% of stations are High (35% or more), 25% Average and 33% Underperforming (below 10%).

Recommendations

1. **Reopen or investigate closed stations first.** Fix the six low-utilization cities, and check whether the data feed is failing rather than the stations.
2. **Rebalance bikes in large cities.** Move bikes from full stations to empty ones in Toulouse, Lyon and Valence, aiming to bring empty stations below 10%.
3. **Favour larger stations** when expanding or upgrading, since they perform best.
4. **Track Empty % and Closed % per city** as weekly KPIs with alerts.
5. **Add time-series data.** About 92% of records are from one day (12 Nov 2025), so trends by month or hour cannot be shown yet.
